Agentic Claims Management

Using quality-checked cases to automate simple, clear claims

Alexander Fuchs | Customer Care | 30 October 2026

Security Class : Internal Only

security class: internal

The problem: manual claims at scale

Thousands of claims (complaints) each year require careful application of legal requirements and internal policies.

Manual handling is costly. Quality varies across agents.
Hundreds of quality checks validate the work after it is done.

Opportunity: reuse verified expertise in every new case.

PILOT SCOPE

Initial scope: simple, clear cases with one subject

Select by case simplicity and clarity, across claim categories

One individual subject

A single issue with a clear customer request.

Enough evidence to assess the case.

An unambiguous outcome under approved policies.

Complex cases excluded

Multiple issues or linked complaints remain with specialists.

Unclear facts, conflicting evidence or policy exceptions are escalated.

Check eligibility first

Identify all issues before handling.

Proceed only if the whole case meets the scope.

If complexity emerges, hand over the complete case.

PROPOSED WORKFLOW

condor

How the potential claim solution works

01 Check eligibility

Identify every subject, assess clarity and check the evidence.
Route multiple issues or ambiguity to a specialist.

02 Apply expertise

Use current approved policies and quality-checked examples.
Validate the recommendation against case facts and rules.

03 Prepare and review

Produce the recommendation, supporting sources and draft reply.
A human approves the outcome during the pilot.

04 Improve and expand

Record corrections and test changes on unseen cases.
Increase automation only when measured quality supports it.

Hackathon deliverable and measures of success

Working prototype	Show one eligible case, one case with missing evidence, and one complex case correctly routed to a specialist.
Quality and efficiency	Compare decisions, replies and routing with expert judgement. Measure total agent effort, including review and rework.
Data and next step	Demonstrate the workflow, then agree a controlled pilot.

Goal: lower handling effort, consistent quality, gradual automation and expansion of scope
